TITLE OF INVENTION

SIMPLIFIED IMPLEMENTATION OF PROTOCOL MACHINES FOR PROTOCOLS WITH A LAYERED STRUCTURE

APPLICANT(S) FOR DO/EO/US

Schwarzbauer et al. Haus, Jürgen.

Applicant herewith submits to the United States Designated/Elected Office (DO/EO/US) the following items and other information:

1. ☒ This is a **FIRST** submission of items concerning a filing under 35 U.S.C. 371.
2. ☐ This is a **SECOND** or **SUBSEQUENT** submission of items concerning a filing under 35 U.S.C. 371.
3. ☒ This is an express request to begin national examination procedures (35 U.S.C. 371(f)). The submission must include items (5), (6), (9) and (24) indicated below.
4. ☒ The US has been elected by the expiration of 19 months from the priority date (Article 31).
5. ☒ A copy of the International Application as filed (35 U.S.C. 371 (c) (2))
 - a. ☒ is attached hereto (required only if not communicated by the International Bureau).
 - b. ☐ has been communicated by the International Bureau.
 - c. ☐ is not required, as the application was filed in the United States Receiving Office (RO/US).
6. ☒ An English language translation of the International Application as filed (35 U.S.C. 371(c)(2)).
 - a. ☒ is attached hereto.
 - b. ☐ has been previously submitted under 35 U.S.C. 154(d)(4).
7. ☒ Amendments to the claims of the International Application under PCT Article 19 (35 U.S.C. 371 (c)(3))
 - a. ☐ are attached hereto (required only if not communicated by the International Bureau).
 - b. ☒ have been communicated by the International Bureau.
 - c. ☐ have not been made; however, the time limit for making such amendments has NOT expired.
 - d. ☐ have not been made and will not be made.
8. ☒ An English language translation of the amendments to the claims under PCT Article 19 (35 U.S.C. 371(c)(3)).
9. ☒ An oath or declaration of the inventor(s) (35 U.S.C. 371 (c)(4)).
10. ☐ An English language translation of the annexes to the International Preliminary Examination Report under PCT Article 36 (35 U.S.C. 371 (c)(5)).
11. ☒ A copy of the International Preliminary Examination Report (PCT/IPEA/409).
12. ☒ A copy of the International Search Report (PCT/ISA/210).

Items 13 to 20 below concern document(s) or information included:

13. ☒ An Information Disclosure Statement under 37 CFR 1.97 and 1.98.
14. ☒ An assignment document for recording. A separate cover sheet in compliance with 37 CFR 3.28 and 3.31 is included.
15. ☒ A **FIRST** preliminary amendment.
16. ☐ A **SECOND** or **SUBSEQUENT** preliminary amendment.
17. ☒ A substitute specification.
18. ☐ A change of power of attorney and/or address letter.
19. ☐ A computer-readable form of the sequence listing in accordance with PCT Rule 13ter.2 and 35 U.S.C. 1.821 - 1.825
20. ☐ A second copy of the published international application under 35 U.S.C. 154(d)(4).
21. ☐ A second copy of the English language translation of the international application under 35 U.S.C. 154(d)(4).
22. ☒ Certificate of Mailing by Express Mail
23. ☐ Other items or information:

U.S. APPLICATION NO. (IF KNOWN, SEE 37 CFR 1.101) 10/019594	INTERNATIONAL APPLICATION NO. PCT/EP00/05918	ATTORNEY'S DOCKET NUMBER 112740-394

SPECIFICATION

TITLE OF THE INVENTION

SIMPLIFIED IMPLEMENTATION OF PROTOCOL MACHINES FOR
PROTOCOLS WITH A LAYERED STRUCTURE

The present invention relates to a protocol machine, which handles
messages using a protocol which includes the functionality for complete, sequence-
protected transmission of messages, with the protocol having a layer structure for
complete, sequence-protected transmission.

Protected, that is to say complete and sequence-protected transmission, is made possible by many communication protocols. In this context, complete transmission refers to all messages transmitted being received. The order of the reception is of no importance here. Furthermore, sequence-protected transmission
5 refers to the messages being received in the order in which they have been transmitted. Loss of messages is permissible. It is advantageous to split a protocol, which guarantees complete and sequence-protected transmission, into two sublayers: one sublayer implements the complete transmission; a sublayer below that then implements the sequence-protected transmission on the basis of the
10 complete transmission. This structure is shown in Figure 1.

The messages carrying user data are also structured in accordance with the structure of the protocol machines. This structure is shown in Figure 2. In the message format, there is a sequence number for sublayer 1 which provides complete transmission. To solve the problem of head-of-line blocking, protocols
15 having a layered structure are based on there being a number of message streams which do not mutually influence one another. To identify its association with a message stream, each message contains an identifier of the message stream to which the message belongs. Finally, each message also contains another number for sequence protection within a message stream. These two data items are used by
20 sublayer 2 for transferring the user data to the user of the protocol in the correct order. Furthermore, there is a message stream which plays a special role in as much as the messages are not transmitted sequence-protected in it, that is to say it is not processed by sublayer 2. Examples of these structures are, e.g., MDTP which is currently being standardized at the IETF, and MSSCOP (to be called SSCOPMCE
25 in future) which is currently being standardized at the ITU. A further example of such a structure can be found in US patent 4,703,475.

However, there are applications in which only complete transmission is needed. For this purpose, protocols could be developed which do exactly this. In practice, however, this is not done but existing protocols are used for protected
30 transmission. As a result, the protocol machines used do more than is required. It is, therefore, advantageous to implement simplified versions of protocol machines

which only guarantee complete transmission and still conform to the protocol. As a result, they can communicate with protocol machines which implement the entire protocol.

5 In most cases, established protocols previously have been used for protected transmission. Special protocols also may be used which only provide for complete transmission.

SUMMARY OF THE INVENTION

A major aspect of the present invention is that the protocol machine, for processing the messages, uses only the functions of the complete transmission of the protocol in conformance with the protocol. The solution specified here allows the implementation of protocol machines for protocols having a layered structure to be considerably simplified if only the complete transmission is needed as function of the protocol. As such, the implementation consists of fewer lines of source code and considerably less resources (storage space, CPU power) are needed at run time. 10 It will be shown that an implementation can even be achieved in such a manner that it can cooperate without problems with protocol machines which use all of the functions of the protocol. For this purpose, the functions of the protocol machine are restricted in such a manner that, apart from the message stream which assumes the special role, no others can be used. However, this requires that the protocol 15 contains the required elements for rejecting unwanted messages. This is provided in MDTP and MSSCOP. 20

A special feature of the present invention lies in the recognition that, for the complete transmission of information, protocols having a layout structure can be used which actually guarantee protected transmission without needing to 25 implement the functions necessary for sequence protection in the protocol machines.

Additional features and advantages of the present invention are described in, and will be apparent from, the following Detailed Description of the Invention and the Figures.

BRIEF DESCRIPTION OF THE FIGURES

Figure 1 shows a protocol, which guarantees complete and sequence-protected transmission, split into two sublayers.

5 Figure 2 shows messages structured in accordance with the structure of a protocol machine.

DETAILED DESCRIPTION OF THE INVENTION

The exemplary embodiment to be provided here is a simplified implementation of a protocol machine for the MDTP protocol which is currently being discussed in its version 5 at the IETF. However, the possibility of rejecting a stream initiation (stream initiation NAK) is already being used here which will only be contained in version 6 of the protocol. It is also assumed that stream 0, a stream having a special role, is modified to the extent that all data parts with stream identifier 0 carry the sequence number 0. As such, that no sequence-protected transmission is possible in stream 0.

15 On the basis of these assumptions, a simplified implementation will be described in comparison with a complete implementation. A complete reference implementation of MDTP will be available shortly.

Firstly, the performance during the processing of received control parts (message components for stream management) will be described:

20 All control parts apart from the stream initiation message are dealt with as in the case of a full implementation. The simplified implementation responds to a stream initiation by sending a corresponding stream initiation Nak. All other messages relating to stream management (stream initiation Ack, stream termination, stream termination Ack) are discarded in conformance with the protocol.

The performance in processing data parts does not differ from the standard: with the circumstances given here, this refers to data parts being discarded, the stream identifier of which is not equal to 0 or the sequence number of which is not equal to 0.

30 The differences in coding the protocol machines are essentially as follows:

in the simplified implementation, the treatment of the stream management messages is trivial: either a message is send out (stream initiation Nak) or the received message is discarded. This essentially saves having to code the treatment of these messages and completely the monitoring of the transmission of these
5 messages. Furthermore, the code responsible for sequence protection within a stream does not need to be implemented. Furthermore, the complete receive buffer, which is needed for sequence protection and may have to be very large since the size of the data parts is only restricted by the size of the UDP datagrams (approx. 64 kB), can be dispensed with. In the simplified implementation, this
10 saves some of the code and the essential part of the memory needed for the implementation.

Although the present invention has been described with reference to specific embodiments, those of skill in the art will recognize that changes may be made thereto without departing from the spirit and scope of the invention as set
15 forth in the hereafter appended claims.

ABSTRACT OF THE DISCLOSURE

Simplified implementation of protocol machines for protocols having a layered structure, wherein the simplified protocol machine which uses the above protocols in conformance with the protocol to provide for only complete transmission.

In the Claims:

On page 6, cancel line 1 and substitute the following left-hand justified heading therefor:

CLAIMS

5 Please cancel claims 1-4, without prejudice, and substitute the following claims therefor:

10 5. A protocol machine for processing messages, comprising a protocol which is used by the protocol machine for the processing of messages, the protocol including functions for complete and sequence-protected transmission of messages and having a layered structure with respect to the complete and sequence-protected transmission, wherein the protocol machine only uses the functions for complete transmission of the protocol in conformance with the protocol.

15 6. A protocol machine as claimed in claim 5, wherein the functions of the protocol machine are restricted such that only a message stream in which the messages are not transmitted sequence-protected can be used for transmitting messages with the aid of the protocol.

20 7. A protocol machine as claimed in claim 5, wherein the protocol is MDTP.

 8. A protocol machine as claimed in claim 5, wherein the protocol is MSSCOP.

REMARKS

25 The present amendment makes editorial changes and corrects typographical errors in the specification, which includes the Abstract, in order to conform the specification to the requirements of United States Patent Practice. No new matter is added thereby.

30 Attached hereto is a marked-up version of the changes made to the specification and claims by the current amendment. The attached page is captioned **"Versions with Markings to Show Changes Made."**

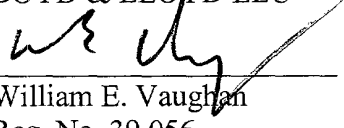

In addition, the present amendment cancels original claims 1-4 in favor of new claims 5-8. Claims 5-8 have been presented solely because the revisions by crossing out underlining which would have been necessary in claims 1-4 in order to present those claims in accordance with preferred United States Patent Practice would have been too extensive, and thus would have been too burdensome. The present amendment is intended for clarification purposes only and not for substantial reasons related to patentability pursuant to 35 U.S.C. §§101, 102, 103 or 112. Indeed, the cancellation of claims 1-4 does not constitute an intent on the part of the Applicants to surrender any of the subject matter of claims 1-4.

Early consideration on the merits is respectfully requested.

Respectfully submitted,

Description

SPECIFICATION

5

TITLE OF THE INVENTION

SIMPLIFIED IMPLEMENTATION OF PROTOCOL MACHINES FOR
PROTOCOLS WITH A LAYERED STRUCTURE

BACKGROUND OF THE INVENTION

The present invention relates to a protocol machine, which handles
10 messages using a protocol which ~~comprises~~ includes the functionality for complete,
sequence-protected transmission of messages, with the protocol having a layer
structure for complete, sequence-protected transmission.

Protected, that is to say complete and sequence-protected transmission, is
made possible by many communication protocols. In this context, complete
15 transmission ~~means that~~ refers to all messages transmitted ~~are being~~ received. The
order of the reception is of no importance here. Furthermore, sequence-protected
transmission ~~means that~~ refers to the messages ~~are being~~ received in the order in
which they have been transmitted. Loss of messages is permissible. It is of
~~advantage~~ advantageous to split a protocol, which guarantees complete and
20 sequence-protected transmission, into two sublayers: one sublayer implements the
complete transmission; a sublayer below that then implements the sequence-
protected transmission on the basis of the complete transmission. This structure is
shown in ~~figure~~ Figure 1.

The messages carrying user data are also structured in accordance with the
25 structure of the protocol machines. This structure is shown in ~~figure~~ Figure 2. In the
message format, there is a sequence number for sublayer 1 which provides
complete transmission. To solve the problem of head-of-line blocking, protocols
having a layered structure are based on there being a number of message streams
which do not mutually influence one another. To identify its association with a
30 message stream, each message contains an identifier of the message stream to
which the message belongs. Finally, each message also contains another number

for sequence protection within a message stream. These two data items are used by sublayer 2 for transferring the user data to the user of the protocol in the correct order. Furthermore, there is a message stream which plays a special role in as much as the messages are not transmitted sequence-protected in it, that is to say it is not
5 processed by sublayer 2. Examples of these structures are, e.g., MDTP which is currently being standardized at the IETF, and MSSCOP (to be called SSCOPMCE in future) which is currently being standardized at the ITU. A further example of such a structure can be found in US patent 4,703,475.

However, there are applications in which only complete transmission is
10 needed. For this purpose, protocols could be developed which do exactly this. In practice, however, this is not done but existing protocols are used for protected transmission. As a result, the protocol machines used do more than is required. It is, therefore, advantageous to implement simplified versions of protocol machines which only guarantee complete transmission and still conform to the protocol. As a
15 result, they can communicate with protocol machines which implement the entire protocol.

In most cases, established protocols ~~have~~ previously have been used for protected transmission. Special protocols ~~may~~ also may be used which only provide for complete transmission.

20 SUMMARY OF THE INVENTION

The A major aspect of the present invention is that the protocol machine, for processing the messages, uses only the functions of the complete transmission of ~~said~~ the protocol in conformance with the protocol. The solution specified here allows the implementation of protocol machines for protocols having a layered
25 structure to be considerably simplified if only the complete transmission is needed as function of the protocol. ~~This means not only that~~ As such, the implementation consists of fewer lines of source code ~~but also that~~ and considerably less resources (storage space, CPU power) are needed at run time. It will be shown that an implementation can even be achieved in such a manner that it can cooperate
30 without problems with protocol machines which use all of the functions of the protocol. For this purpose, the functions of the protocol machine are restricted in

such a manner that, apart from the message stream which assumes the special role, no others can be used. However, this requires that the protocol contains the required elements for rejecting unwanted messages. This is provided in MDTP and MSSCOP.

5 A special feature of the present invention ~~relies~~ lies in the recognition that, for the complete transmission of information, protocols having a layout structure can be used which actually guarantee protected transmission without needing to implement the functions necessary for sequence protection in the protocol machines.

10 Additional features and advantages of the present invention are described in, and will be apparent from, the following Detailed Description of the Invention and the Figures.

BRIEF DESCRIPTION OF THE FIGURES

15 Figure 1 shows a protocol, which guarantees complete and sequence-protected transmission, split into two sublayers.

Figure 2 shows messages structured in accordance with the structure of a protocol machine.

DETAILED DESCRIPTION OF THE INVENTION

20 The exemplary embodiment to be provided here is a simplified implementation of a protocol machine for the MDTP protocol which is currently being discussed in its version 5 at the IETF. However, the possibility of rejecting a stream initiation (stream initiation NAK) is already being used here which will only be contained in version 6 of the protocol. It is also assumed that stream 0, a stream having a special role, is modified to the extent that all data parts with stream
25 identifier 0 carry the sequence number 0. ~~This means~~ As such, that no sequence-protected transmission is possible in stream 0.

 On the basis of these assumptions, a simplified

implementation will be described in comparison with a complete implementation.
A complete reference implementation of MDTP will be available shortly.

Firstly, the performance during the processing of received control parts
(message components for stream management) will be described:

5 All control parts apart from the stream initiation message are dealt with as
in the case of a full implementation. The simplified implementation responds to a
stream initiation by sending a corresponding stream initiation Nak. All other
messages relating to stream management (stream initiation Ack, stream
termination, stream termination Ack) are discarded in conformance with the
10 protocol.

The performance in processing data parts does not differ from the standard:
with the circumstances given here, this ~~means that~~ refers to data parts are being
discarded, the stream identifier of which is not equal to 0 or the sequence number
of which is not equal to 0.

15 The differences in coding the protocol machines are essentially as follows:
in the simplified implementation, the treatment of the stream management
messages is trivial: either a message is send out (stream initiation Nak) or the
received message is discarded. This essentially saves having to code the treatment
of these messages and completely the monitoring of the transmission of these
20 messages. Furthermore, the code responsible for sequence protection within a
stream does not need to be implemented. Furthermore, the complete receive buffer,
which is needed for sequence protection and may have to be very large since the
size of the data parts is only restricted by the size of the UPD datagrams
(approx. 64 kB), can be dispensed with. In the simplified implementation, this
25 saves some of the code and the essential part of the memory needed for the
implementation.

Although the present invention has been described with reference to
specific embodiments, those of skill in the art will recognize that changes may be
made thereto without departing from the spirit and scope of the invention as set
30 forth in the hereafter appended claims.

Abstract

ART 34 AMDT

Description

Simplified implementation of protocol machines for protocols with a layered structure

5

The invention relates to a protocol machine, which handles messages using a protocol which comprises the functionality for complete, sequence-protected transmission of messages, with the protocol having a layer structure for complete, sequence-protected transmission.

Protected, that is to say complete and sequence-protected transmission is made possible by many communication protocols. In this context, complete transmission means that all messages transmitted are received. The order of the reception is of no importance here. Furthermore, sequence-protected transmission means that the messages are received in the order in which they have been transmitted. Loss of messages is permissible. It is of advantage to split a protocol, which guarantees complete and sequence-protected transmission, into two sublayers: one sublayer implements the complete transmission; a sublayer below that then implements the sequence-protected transmission on the basis of the complete transmission. This structure is shown in figure 1.

The messages carrying user data are also structured in accordance with the structure of the protocol machines. This structure is shown in figure 2. In the message format, there is a sequence number for sublayer 1 which provides complete transmission. To solve the problem of head-of-line blocking, protocols having a layered structure are based on there being a number of message streams which do not mutually influence one another. To identify its association with a message stream, each

199902141

- 1a -

message contains an identifier of the message stream
to which

199902141

the message belongs. Finally, each message also contains another number for sequence protection within a message stream. These two data items are used by sublayer 2 for transferring the user data to the user of the protocol in the correct order. Furthermore, there is a message stream which plays a special role in as much as the messages are not transmitted sequence-protected in it, that is to say it is not processed by sublayer 2. Examples of these structures are, e.g., MDTP which is currently being standardized at the IETF, and MSSCOP (to be called SSCOPMCE in future) which is currently being standardized at the ITU. A further example of such a structure can be found in US patent 4,703,475.

However, there are applications in which only complete transmission is needed. For this purpose, protocols could be developed which do exactly this. In practice, however, this is not done but existing protocols are used for protected transmission. As a result, the protocol machines used do more than is required. It is, therefore, advantageous to implement simplified versions of protocol machines which only guarantee complete transmission and still conform to the protocol. As a result, they can communicate with protocol machines which implement the entire protocol.

In most cases, established protocols have previously been used for protected transmission. Special protocols may also be used which only provide for complete transmission.

The major aspect of the present invention is that the protocol machine, for processing the messages, uses only the functions of the complete transmission of said protocol in conformance with the protocol. The solution specified here allows the implementation of protocol machines for protocols having a layered structure

to be considerably simplified if only the complete transmission is needed as function of the protocol. This means not only that the implementation consists of fewer lines of source code but also that considerably less resources (storage space, CPU power) are needed at run time. It will be shown that an implementation can even be achieved in such a manner that it can cooperate without problems with protocol machines which use all of the functions of the protocol. For this purpose, the functions of the protocol machine are restricted in such a manner that, apart from the message stream which assumes the special role, no others can be used. However, this requires that the protocol contains the required elements for rejecting unwanted messages. This is provided in MDTP and MSSCOP.

A special feature of the invention relies in the recognition that, for the complete transmission of information, protocols having a layout structure can be used which actually guarantee protected transmission without needing to implement the functions necessary for sequence protection in the protocol machines.

The exemplary embodiment to be provided here is a simplified implementation of a protocol machine for the MDTP protocol which is currently being discussed in its version 5 at the IETF. However, the possibility of rejecting a stream initiation (stream initiation NAK) is already being used here which will only be contained in version 6 of the protocol. It is also assumed that stream 0, a stream having a special role, is modified to the extent that all data parts with stream identifier 0 carry the sequence number 0. This means that no sequence-protected transmission is possible in stream 0.

On the basis of these assumptions a simplified

implementation will be described in comparison with a
complete

109221 46967001

implementation. A complete reference implementation of MDTP will be available shortly.

5 Firstly, the performance during the processing of received control parts (message components for stream management) will be described:

10 All control parts apart from the stream initiation message are dealt with as in the case of a full implementation. The simplified implementation responds to a stream initiation by sending a corresponding stream initiation Nak. All other messages relating to stream management (stream initiation Ack, stream termination, stream termination Ack) are discarded in
15 conformance with the protocol.

The performance in processing data parts does not differ from the standard:
20 with the circumstances given here, this means that data parts are discarded the stream identifier of which is not equal to 0 or the sequence number of which is not equal to 0.

25 The differences in coding the protocol machines are essentially as follows:
in the simplified implementation, the treatment of the stream management messages is trivial: either a message is send out (stream initiation Nak) or the received message is discarded. This essentially saves having to
30 code the treatment of these messages and completely the monitoring of the transmission of these messages. Furthermore, the code responsible for sequence protection within a stream does not need to be implemented. Furthermore, the complete receive buffer,
35 which is needed for sequence protection and may have to be very large since the size of the data parts is only

- 4a -

restricted by the size of the UPD datagrams (approx. 64 kB), can be dispensed with. In the simplified implementation, this saves some of the

code and the essential part of the memory needed for the implementation.

FOOTNOTES

Patent Claims

1. A protocol machine which uses for the processing
of messages a protocol which comprises the
5 functions for complete and sequence-protected
transmission of messages, the protocol exhibiting
a layered structure with respect to the complete
and sequence-protected transmission, characterized
in that the protocol machine for processing the
10 messages only using the functions of complete
transmission of said protocol in conformance with
the protocol.
2. The protocol machine as claimed in claim 1,
15 characterized in that the functions of the
protocol machine are restricted in such a manner
that only the message stream in which the messages
are not transmitted sequence-protected can be used
for transmitting messages with the aid of the
20 protocol.
3. The protocol machine as claimed in claim 1 or 2,
characterized in that said protocol is the MDTP.
- 25 4. The protocol machine as claimed in claim 1 or 2,
characterized in that said protocol is the MSSCOP.

Erklärung Für Patentanmeldungen Mit Vollmacht

German Language Declaration

Als nachstehend benannter Erfinder erkläre ich hiermit an Eides Statt:

As a below named inventor, I hereby declare that:

dass mein Wohnsitz, meine Postanschrift, und meine Staatsangehörigkeit den im Nachstehenden nach meinem Namen aufgeführten Angaben entsprechen,

My residence, post office address and citizenship are as stated below next to my name,

dass ich, nach bestem Wissen der ursprüngliche, erste und alleinige Erfinder (falls nachstehend nur ein Name angegeben ist) oder ein ursprünglicher, erster und Miterfinder (falls nachstehend mehrere Namen aufgeführt sind) des Gegenstandes bin, für den dieser Antrag gestellt wird und für den ein Patent beantragt wird für die Erfindung mit dem Titel:

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled

abgeändert wurde (falls tatsächlich abgeändert).

(if applicable)

Ich bestätige hiermit, dass ich den Inhalt der obigen Patentanmeldung einschliesslich der Ansprüche durchgesehen und verstanden habe, die eventuell durch einen Zusatzantrag wie oben erwähnt abgeändert wurde.

I hereby state that I have reviewed and understand the contents of the above identified specification, including the claims as amended by any amendment referred to above.

Ich erkenne meine Pflicht zur Offenbarung irgendwelcher Informationen, die für die Prüfung der vorliegenden Anmeldung in Einklang mit Absatz 37, Bundesgesetzbuch, Paragraph 1.56(a) von Wichtigkeit sind, an.

I acknowledge the duty to disclose information which is material to the examination of this application in accordance with Title 37, Code of Federal Regulations, §1.56(a).

Ich beanspruche hiermit ausländische Prioritätsvorteile gemäss Abschnitt 35 der Zivilprozessordnung der Vereinigten Staaten, Paragraph 119 aller unten angegebenen Auslandsanmeldungen für ein Patent oder eine Erfindersurkunde, und habe auch alle Auslandsanmeldungen für ein Patent oder eine Erfindersurkunde nachstehend gekennzeichnet, die ein Anmeldedatum haben, das vor dem Anmeldedatum der Anmeldung liegt, für die Priorität beansprucht wird.

I hereby claim foreign priority benefits under Title 35, United States Code, §119 of any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate having a filing date before that of the application on which priority is claimed:
